

Water Is Our Profession

PC Spray Stake Unit

Benefits

- Improves distribution and efficiency of pot plant irrigation
- Prevents the formation of internal channels in soil-less substrates that cause inefficient irrigation
- Allows better water uptake by the substrate

Applications

- Mainly in medium/large pots (over 30cm diameter)
- Cut flower nurseries
- Container tree nurseries
- Open ground tree nurseries
- Specimen plant growers

Product

- PCJ dripper 12 ltr/hr (standard or CNL on request)
- 0.6, 0.8, or 1.0 metre micro tube length depending on application
- Elbow connector with barb at one end to hold micro tube and the other end female cylinder shaped for connection to the spray stake
- The above three are supplied ready assembled
- Spray stake is coloured purple and incorporates a stopper when not in use
- It is recommended that the spray stake be installed at the pot edge to simplify its placement, make it visible during operation and to easy remove when required.
- Water will be distributed 30-35cm from the stakes position. An extender is available if required.
